PASTEUR AND MODERN SCIENCE

Pasteur and Modern Science is a fresh account of the extraordinary life of Louis Pasteur. His spectacular discoveries and his remarkable vision have, with the dramatic growth of biochemistry, microbiology, bacteriology and immunology, continuously increased in importance. His legendary experiments with sour milk, wine, vinegar, beer, diseased silk-worms, anthrax, rabies,—and especially his original studies of fermentation and his masterful proof of the germ theory of disease—have been instrumental in the development of wonder drugs, the polio vaccine, and many other recent industrial, agricultural, and medical advances. Told with many personal touches, Pasteur and Modern Science is an inspiring biography of a man whose scientific creation remains eternally young and constitutes 'one of the great achievements of human thought.'
